FLEET PARTNER PROGRAMME · FRANKFURT PILOT

EELS Fleet Portal — Improvement Plan

A shareable business brief on twelve upgrades that turn our Frankfurt sub-fleet into the compliant, evidence-grade partner Uber Eats, Wolt and Lieferando need in Germany.

Frankfurt Pilot

PTOD target 98.5%

EU Platform Work Directive-ready

ArbZG + MiLoG native

EELS GmbH · Prepared September 2026 · Business audience · v1

EXECUTIVE SUMMARY

One control tower for three platforms.

Today most sub-fleets in Germany run on **Excel + WhatsApp**. That's the market we're replacing — with a single cockpit that unifies Uber Eats, Wolt and Lieferando, encodes German labour law directly into dispatch, and hands each platform a quarterly evidence pack that keeps the contract renewing.

ON-TIME DELIVERY	PLATFORMS UNIFIED	REGULATIONS ENCODED	LEGAL EXPOSURE AVOIDED
98.5%	**3**	**6**	**30 y**
Internal PTOD target	Uber Eats · Wolt · Lieferando	ArbZG · MiLoG · Minijob · PWD · DSGVO · BG Verkehr	Scheinselbständigkeit back-SV horizon

> **"Give us the raw events. We'll operate a compliant, predictable fleet with 98.5% PTOD and hand you evidence-grade data back."**

WHAT THE PLATFORMS CANNOT BUILD

- **One canonical view** when a driver serves Uber and Wolt in the same shift.
- **German labour compliance** baked into the dispatcher, not a lawyer's PDF.
- **Quarterly Health Pack** that helps their fleet manager renew our contract.

WHY NOW

- **EU Platform Work Directive (2024/2831)** reverses burden of proof on classification.
- **BAG 13 Sep 2022** ruling made electronic time-tracking mandatory.
- **Minijob €556** threshold since 1 Jan 2025 — legacy tooling is out of date.

CONTENTS

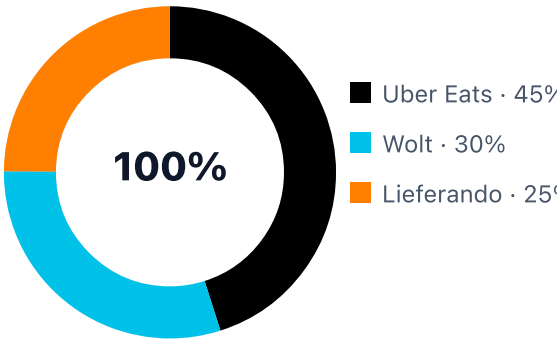

1. The market picture
2. Twelve improvements — the pitch, one page each theme
3. Uber Eats + Wolt API compatibility (technical assurance)
4. Rollout roadmap

5. What we ask of the platforms

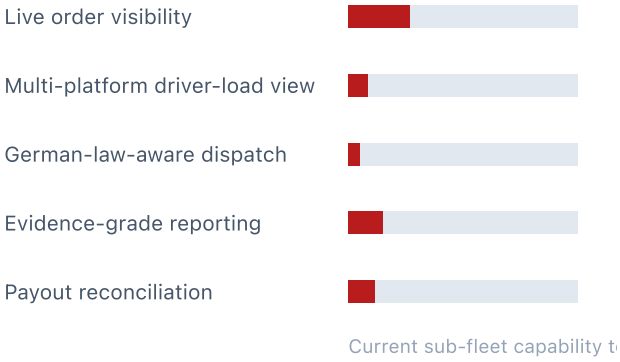

1 · The market picture

Frankfurt gig-delivery is served by three big platforms and a long tail of small sub-fleets. **The sub-fleet is the operator; the platform is the demand.** The platforms have strong tech for their own orders but almost no visibility into a fleet's *day*: who's on break, whose *Aufenthaltstitel* expires next week, or whether a driver's total working time across all three apps has crossed ArbZG limits.

DEMAND SHARE ACROSS PLATFORMS (ILLUSTRATIVE, FRANKFURT PILOT)

THE EXCEL-PLUS-WHATSAPP GAP

Where the pain lives

LEGAL

- Scheinselbständigkeit — up to 30 y back-SV
- Platform Work Directive (2024/2831)
- ArbZG 8/10 h caps · 11 h rest

OPERATIONAL

- Driver churn & no-shows
- Language barriers (DE/EN/AR/UR/TR/PL)
- Visa & *Duldung* expiry tracking

FINANCIAL

- 3 platforms · 3 payout cadences
- Tips only in weekly CSV
- Cash orders not in any API

2 · The twelve improvements

1 Unified Order Inbox

One live queue showing every order from Uber Eats Wolt Lieferando side by side. Filter by zone, courier, status, ETA-risk, restaurant. Save filter combinations as pinnable views.

> **Why it wins:** The platforms cannot build this — they only see their own orders. We become the single source of truth about the driver's day.

2 Delay-Cause Analysis

Every late order gets a structured reason — restaurant prep, courier wait at pickup, traffic, address issue, handover, batching. Ops picks in one click. Pareto by restaurant/zone/hour.

> **Why it wins:** Uber and Wolt burn money on refunds for late orders. Proving "78% of your Frankfurt lateness is one restaurant's prep-time" saves them money — that's the case for a preferred-fleet contract.

3 Reports Centre — per app / zone / driver / order / delay-cause

Pivot any two dimensions across platform · zone · driver · restaurant · delay cause · hour. Export to CSV. Scheduled weekly digests to BD managers.

> **Why it wins:** This is the raw material for the quarterly *Platform Health Pack* — evidence that keeps the contract renewing.

4 Canonical Courier State Machine

Uber calls it `pickup_complete`, Wolt calls it `production`, Lieferando has no event at all. We translate all three into one canonical lifecycle so operators see the same words everywhere.

> **Why it wins:** When a driver serves two platforms in a shift, only we know both. Platforms cannot coordinate with each other — we coordinate for them.

5

Compliance-as-Code (Germany-specific)

Dispatch *refuses* orders that would break ArbZG. Real-time Minijob €556 gauge with alert at 90%. Cross-platform working-time aggregator. Führerscheinkontrolle scheduler. Document-expiry cockpit.

> **Why it wins:** After the Platform Work Directive, platforms are presumed employers unless they prove otherwise. A compliant fleet de-risks their whole German operation.

6

Algorithmic Transparency Log

Every automated decision logged with signals, weights, and a plain-language reason. Drivers can view their own log ("Why did I get this order?"). Regulators can audit.

> **Why it wins:** Platform Work Directive Arts. 6–8 and DSGVO Art. 15 both require this. We ship it out of the box; the platforms don't have to build it.

7

Payout Reconciliation Queue

Ingest weekly settlement CSVs from all three platforms, match to canonical order IDs, surface missing or short-paid orders as a review queue with a claim workflow.

> **Why it wins:** Sub-fleets lose 1–3% of revenue to reconciliation gaps. Fixing it improves courier NPS (paid correctly, on time), which cuts churn — a top platform metric.

8

Hex Demand-vs-Supply Heatmap

Frankfurt tiled into hexagons (Uber's own H3 pattern). Live view of hexes with too many orders and too few couriers; system suggests reposition targets.

> **Why it wins:** This is how Uber runs surge internally. We prove we speak their operational language.

9

Prep-Time Prediction per Restaurant

Learn each restaurant's real prep time by hour and day, then dispatch couriers to arrive just in time. No wait at pickup.

> **Why it wins:** Courier wait-at-pickup is the #1 delay cause on Uber. Cutting it 20% improves *their* customer ETAs — direct revenue impact.

10

Multilingual Driver Comms

Broadcast in DE · EN · AR · UR · TR · PL with must-acknowledge receipts. Safety notices flagged read-required.

> **Why it wins:** Reduces incident rate and churn — both platform-tracked. Directly answers the Gorillas-style rider-conflict risk the platforms want to avoid.

11

Safety Center — SOS · Crash-Detect · Incident Log

SOS swipe → auto-share location to a safety desk. Accelerometer crash-detect. Severe-weather auto-pause. Every incident logged for BG Verkehr reporting (next working day).

> **Why it wins:** Platforms are terrified of another Gorillas-style headline. We ship the safety infrastructure ready-made.

12

Platform Health Pack (quarterly PDF)

One-click export: PTOD, delay-cause Pareto, retention, incident log, DSAR readiness, compliance attestation. Branded per platform.

> **Why it wins:** This is the artefact the platform's fleet BD manager takes to *their* leadership. If we make them look good internally, they renew our contract.

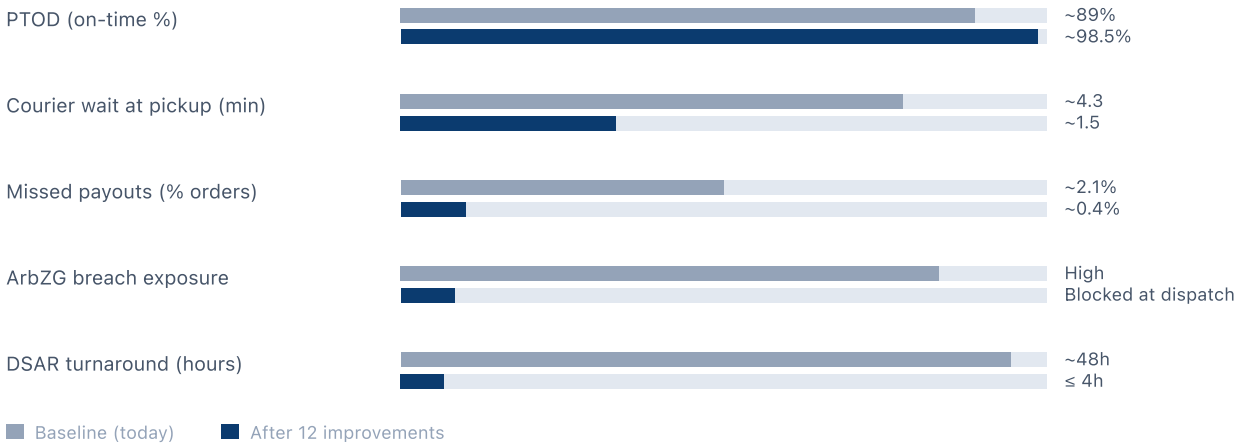

3 · Compliance heatmap — what the system enforces

Each regulation below is encoded into the portal — either as a dispatch block, a documentation trail, or a scheduled reminder.

REGULATION	WHAT IT DEMANDS	HOW WE COVER IT	EXPOSURE IF MISSED
EU Platform Work Directive 2024/2831	Presumption of employment · algorithmic transparency · human oversight	Algorithmic Transparency Log · dispute workflow · human-in-the-loop	Existential
ArbZG (Arbeitszeitgesetz)	8/10-hour cap · 30/45-min break · 11-hour rest	Dispatch-time enforcement · cross-platform working-time aggregator	High
MiLoG §17 + BAG 13 Sep 2022	Elektronische Zeiterfassung · 7-day record · 2-year retention	GPS-anchored clock-in/out · Zoll/FKS export	High
Minijob threshold €556 / month	Cap monthly earnings · avoid aggregation trap	Real-time earnings gauge · 90% alert · multi-minijob detector	Medium
Scheinselbständigkeit	Genuine self-employment tests	Employment-classification risk scorer per contract	30 y back-SV
Führerscheinkontrolle	Biannual driver-licence check	Automatic reminder + in-app photo verification	Employer duty
BG Verkehr	Report accidents by next working day	Safety Center · one-click report · SLA tracker	Medium
DSGVO Art. 15	Right of access (DSAR)	Per-driver JSON export from Algorithmic Transparency Log	Regulatory

Impact of the twelve improvements — projected

BEFORE → AFTER (FRANKFURT PILOT TARGETS)

PTOD (on-time %)
~89%
~98.5%
Courier wait at pickup (min)
~4.3
~1.5
Missed payouts (% orders)
~2.1%
~0.4%
ArbZG breach exposure
High
Blocked at dispatch
DSAR turnaround (hours)
~48h
≤ 4h
Baseline (today)
After 12 improvements

4 · Uber Eats + Wolt API compatibility

Every improvement respects the actual event shapes the platforms expose. Nothing in this plan assumes an API surface that doesn't exist.

UBER EATS

- **HMAC-SHA256** `x-uber-signature`
- Legacy `x-postmates-signature` still accepted
- 4 webhook kinds: `delivery_status`, `courier_update`, `refund_request`, `shopping_progress`
- Retry: 3 attempts, no 4xx retry → we reconcile via REST poll

WOLT

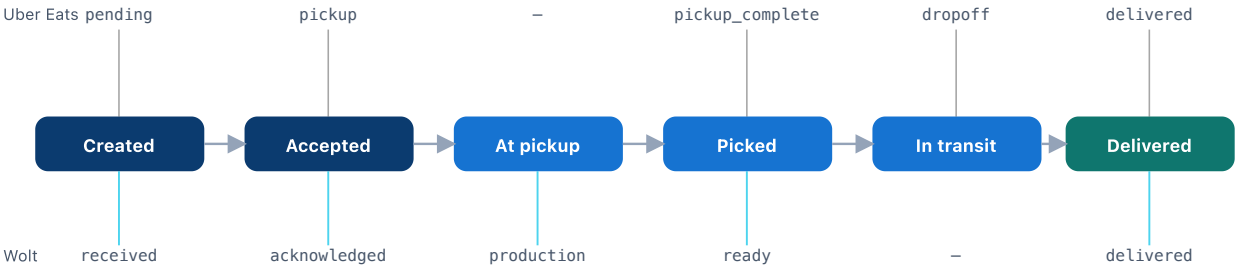

- **OAuth 2.0 → JWT bearer (HS256)**
- Merchant lifecycle: `received` / `fetched` / `acknowledged` / `production` / `ready` / `delivered` / `rejected` / `refunded`
- Courier data intentionally minimal (no name/phone/ID at venue)
- Pickup ETA as ISO 8601

LIEFERANDO

- No public partner API
- Captured via POS tablet integration or manual entry
- Normalised into the same canonical state as the others

Canonical state map

EACH RAW PLATFORM STATE RESOLVES TO ONE CANONICAL COURIER LIFECYCLE

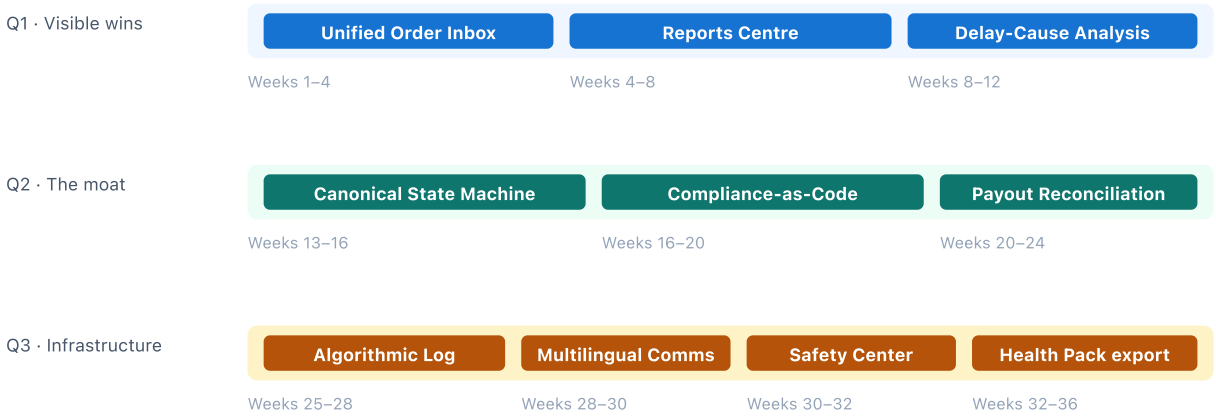

THE MOAT

When one driver serves Uber and Wolt in the same shift, only the fleet portal knows both. Platforms cannot coordinate with each other — we coordinate for them. That is the product.

5 · Rollout roadmap

Twelve improvements delivered in three quarters, sequenced by pitch value first (visible wins), then moat, then infrastructure.

What we ask of each platform

UBER EATS

- Webhook signing key for `delivery_status`, `courier_update`
- Fleet-scoped REST access for reconciliation polling
- Named fleet BD contact for the Health Pack review

WOLT

- Wolt Order API OAuth credentials · JWT signing key
- Weekly settlement CSV drop
- Optional: Wolt Drive courier telemetry for direct-mode orders

LIEFERANDO

- Restaurant-POS integration (Deliverect / direct)
- Monthly settlement CSV
- Scoober liaison for shared-shift drivers

> **"Excel and WhatsApp can't renew a contract. A Platform Health Pack can."**
